Abstract

We consider the asymptotic behavior of solutions to a class of third-order neutral differential equations with distributed deviating arguments. Our criteria extend the related results reported in the literature. An illustrative example is included.

Keywords: Asymptotic behavior, neutral differential equation, third-order, distributed deviating argument, oscillation.

2010 MSC: 34K11.

1. Introduction

Third-order differential equations arise in the study of entry-flow phenomenon, a problem of hydrodynamics, three-layer beams, and so forth; see the monograph [12] and papers [9, 15]. Analysis of the oscillation and asymptotic behavior of solutions to various classes of third-order differential equations always attracted interest of researchers; see, e.g., [1–11, 13–19, 22] and the references cited therein.

In this paper, we consider the asymptotic properties of solutions to a class of third-order neutral equations with distributed deviating arguments

\[
\left( a(t) \left[ (b(t) [x(t) + p(t)x(\sigma(t))]')' \right] \right)^{\alpha} + \int_c^d q(t, \xi)f(x(\tau(t, \xi)))d\xi = 0, \tag{1.1}
\]

where \( t \geq t_0 \) and \( \alpha > 0 \) is a ratio of two odd positive integers. Throughout this paper, we assume that the following hypotheses hold:

\( (H_1) \) \( a(t), b(t), p(t) \in C([t_0, \infty), \mathbb{R}), \ a(t) > 0, \ b(t) > 0, \ 0 \leq p(t) \leq p_0 < 1, \ \int_{t_0}^{\infty} a^{-1/\alpha}(t)dt = \infty, \ \int_{t_0}^{\infty} b(t)^{-1}dt = \infty, \ q(t, \xi) \in C([t_0, \infty) \times [c, d] \times [0, \infty]), \) and \( q(t, \xi) \) is not identically zero for large \( t; \)

\((H_2)\) \(\sigma(t) \in C([t_0, \infty), \mathbb{R})\), \(\sigma(t) \leq t\), \(\lim_{t \to \infty} \sigma(t) = \infty\), \(\tau(t, \xi) \in C([t_0, \infty) \times [c, d], \mathbb{R})\) is a nondecreasing function for \(\xi\), satisfying \(\tau(t, \xi) \leq t\), and \(\liminf_{t \to \infty} \tau(t, \xi) = \infty\) for \(\xi \in [c, d]\);

\((H_3)\) \(f \in C(\mathbb{R}, \mathbb{R})\) and there exists a positive constant \(k\) such that \(f(u)/u^\alpha \geq k\) for all \(u \neq 0\).

Let
\[ z(t) := x(t) + p(t)x(\sigma(t)) \]

By a solution to \((1.1)\) we mean a nontrivial function \(x(t) \in C([t_\infty, \infty), \mathbb{R})\), \(t_\infty \geq t_0\), such that \(z(t) \in C^1([t_\infty, \infty), \mathbb{R})\), \(b(t)z'(t) \in C^1([t_\infty, \infty), \mathbb{R})\), \(a(t)[(b(t)z'(t))']\alpha \in C^1([t_\infty, \infty), \mathbb{R})\) and \(x(t)\) satisfies \((1.1)\) on the interval \([t_\infty, \infty)\). The solutions vanishing in some neighborhood of infinity will be excluded from our consideration. A solution of \((1.1)\) is said to be oscillatory if it is neither eventually positive nor eventually negative; otherwise, it is termed nonoscillatory.

In what follows, we present some background details that motivate the contents of this paper. Agarwal et al. [1–4] and Li and Rogovchenko [17] studied the asymptotic behavior of a third-order delay differential equation
\[ (a(t)(x''(t))^\alpha)' + q(t)f(x(\tau(t))) = 0. \]

Baculíková and Džurina [5], Jiang et al. [14], Jiang and Li [15], and Li and Zhang [18] considered the asymptotic properties of a class of third-order neutral differential equations
\[ (a(t)\left([x(t) + p(t)x(\sigma(t))]''\right)^\alpha)' + q(t)x^\alpha(\tau(t)) = 0, \]

whereas Došlák and Liška [9] and Li et al. [19] investigated a general third-order neutral differential equation
\[ (a(t)\left(b(t)\left[x(t) + p(t)x(\sigma(t))\right]''\right)' + q(t)x(\tau(t)) = 0. \]

Bohner et al. [6, 7] and Džurina and Kotorová [10] studied the oscillatory behavior of a third-order delay differential equation with damping
\[ x''''(t) + p(t)x''(t) + q(t)f(x(\tau(t))) = 0, \]

whereas Li and Rogovchenko [16] considered a third-order delay differential equation
\[ x''''(t) + p(t)x''(t) + q(t)f(x(\tau(t))) = 0. \]

Candan [8], Fu et al. [11], Jiang et al. [13], Şenel and Utku [20, 21], and Tian et al. [22] established several criteria for the oscillation and asymptotic behavior of a third-order neutral differential equation with distributed deviating arguments
\[ \left( a(t)\left([x(t) + p(t)x(\sigma(t))]''\right)^\alpha \right)' + \int_{c}^{d} q(t, \xi)f(x(\tau(t, \xi)))d\xi = 0. \]

Assuming that \(u(t)\) is a positive solution of the equation \(u''''(t) + p(t)u(t) = 0\), it is not difficult to see that equations
\[ x''''(t) + p(t)x''(t) + \int_{c}^{d} q(t, \xi)f(x(\tau(t, \xi)))d\xi = 0 \]

and
\[ \left( u^2(t)\left(\frac{1}{u(t)}x'(t)\right)\right)' + u(t)\int_{c}^{d} q(t, \xi)f(x(\tau(t, \xi)))d\xi = 0 \]

are equivalent, and hence it is interesting to study equation \((1.1)\).

In the sequel, all functional inequalities are assumed to hold eventually.
2. Auxiliary lemmas

To prove our main results, we need the following useful lemmas.

Lemma 2.1. Let conditions (H₁)-(H₃) be satisfied and suppose that \(x(t)\) is an eventually positive solution of (1.1). Then there are only the following two possible cases for \(z(t)\):

(I) \(z(t) > 0, z'(t) > 0, (b(t)z'(t))' > 0,\) and \(\left(a(t) \left[(b(t)z'(t))'\right]^{\alpha}\right)' \leq 0;\)

(II) \(z(t) > 0, z'(t) < 0, (b(t)z'(t))' > 0,\) and \(\left(a(t) \left[(b(t)z'(t))'\right]^{\alpha}\right)' \leq 0,

for \(t \geq t₁,\) where \(t₁ \geq t₀\) is sufficiently large.

Proof. The proof is simple, and so is omitted.

Lemma 2.2. Let \(x(t)\) be an eventually positive solution of (1.1). If \(z(t)\) satisfies case (I) in Lemma 2.1, then for all sufficiently large \(t₁ \geq t₀\) there exists a \(t₂ > t₁\) such that, for \(t \geq t₂,

\[
\frac{z(t)}{b(t)z'(t)} \geq \int_{t₂}^{t} \frac{\int_{t₁}^{s} a^{-1/\alpha}(u)du}{b(s)} \frac{ds}{\int_{t₁}^{s} a^{-1/\alpha}(u)du}
\]

and \(b(t)z'(t)/\int_{t₁}^{t} a^{-1/\alpha}(u)du\) is nonincreasing eventually.

Proof. The proof is similar to that of [13, Lemma 2.2], and hence is omitted.

 Lemma 2.3. Let \(x(t)\) be an eventually positive solution of (1.1) and assume that \(z(t)\) satisfies case (II) in Lemma 2.1. If

\[
\int_{t₀}^{\infty} \frac{1}{b(v)} \int_{v}^{\infty} \left(\frac{1}{a(u)} \int_{u}^{d} q(s, \xi)d\xi ds\right)^{1/\alpha} du dv = \infty,
\]

then \(\lim_{t \to \infty} x(t) = 0.\)

Proof. The proof is similar to that of [5, Lemma 2], and therefore is omitted.

3. Main results

For simplicity, we introduce the following notation:

\[
q₁(t) := k(1-p₀)^α \int_{c}^{d} q(t, \xi) d\xi, \quad \tau₁(t) := \tau(t, c),
\]

\[
ρ₊'(t) := \max(0, ρ₊'(t)), \quad \text{and} \quad G(t) := ρ(t) q₁(t) \left(\frac{\int_{t₂}^{τ₁(t)} \left(\int_{t₁}^{s} a^{-1/\alpha}(u)du/b(s)\right) ds}{\int_{t₁}^{t} a^{-1/\alpha}(u)du}\right)^{α},
\]

where the meaning of \(ρ(t)\) will be explained later.

Theorem 3.1. Assume that conditions (H₁)-(H₃) and (2.1) hold. If there exists a function \(ρ(t) \in C^1([t₀, \infty), (0, \infty))\) such that, for all sufficiently large \(t₁ \geq t₀\) and for some \(t₃ > t₂ > t₁,

\[
\limsup_{t \to \infty} \int_{t₃}^{t} \left(G(s) - \frac{1}{(α + 1)^{1+α}} \frac{a(s)(ρ₊'(s))^{1+α}}{ρ^{α}(s)}\right) ds = \infty,
\]

then every solution \(x(t)\) of (1.1) is either oscillatory or satisfies \(\lim_{t \to \infty} x(t) = 0.\)
Proof. Let \( x(t) \) be a nonoscillatory solution of (1.1). Without loss of generality, we may assume that \( x(t) \) is eventually positive. ByLemma 2.1, \( z(t) \) satisfies either case (I) or case (II).

Assume first that case (I) holds for \( t \geq t_1 \). By virtue of the definition of \( z(t) \),
\[
x(t) = z(t) - p(t)x(\sigma(t)) \geq z(t) - p(t)z(\omega(t)) \geq (1 - p_0)z(t).
\]
(3.2)

It follows from (1.1) and (3.2) that
\[
\left( a(t) \left[ \frac{(b(t)z'(t))}{z(t)} \right]^\alpha \right)' \leq -k \int_c^d q(t, \xi)x^\alpha(\tau(t, \xi))d\xi,
\]
\[
\leq -k(1 - p_0)^\alpha \int_c^d q(t, \xi)z^\alpha(\tau(t, \xi))d\xi,
\]
\[
\leq -k(1 - p_0)^\alpha z^\alpha(\tau_c) \int_c^d q(t, \xi)d\xi = -q_1(t)z^\alpha(\tau_1(t)).
\]
(3.3)

Define a new function \( \omega(t) \) by
\[
\omega(t) := \rho(t) a(t) \left[ \frac{(b(t)z'(t))}{z(t)} \right]^\alpha.
\]
(3.4)

Then \( \omega(t) > 0 \) and
\[
\omega'(t) = \frac{\rho'(t)}{\rho(t)} \omega(t) + \rho(t) \left( \frac{a(t) \left[ (b(t)z'(t)) \right]^\alpha}{(b(t)z'(t))} \right)' - \alpha \rho(t) a(t) \left[ (b(t)z'(t)) \right]^{\alpha+1}.
\]
(3.5)

By (3.4), we get
\[
\left( \frac{(b(t)z'(t))}{z(t)} \right)^{\alpha+1} = \left( \frac{\omega(t)}{\rho(t) a(t)} \right)^{\alpha+1}.
\]
(3.6)

Substituting (3.3) and (3.6) into (3.5), we conclude that
\[
\omega'(t) \leq \frac{\rho'(t)}{\rho(t)} \omega(t) - \rho(t) q_1(t) \left( \frac{\omega(t)}{\rho(t) a(t)} \right) \left( \frac{\omega(t)}{(b(t)z'(t))} \right)^\alpha
\]
\[
= \frac{\rho'(t)}{\rho(t)} \omega(t) - \rho(t) q_1(t) \left( \frac{\omega(t)}{\rho(t) a(t)} \right) \left( \frac{\omega(t)}{\rho(t) a(t)} \right)^{\alpha+
\]
\[
\rho'(t) \leq \frac{\rho'(t)}{\rho(t)} \omega(t) - \rho(t) q_1(t) \left( \frac{\omega(t)}{\rho(t) a(t)} \right) \left( \frac{\omega(t)}{\rho(t) a(t)} \right)^{\alpha+
\]
\[
\rho'(t) \leq \frac{\rho'(t)}{\rho(t)} \omega(t) - \rho(t) q_1(t) \left( \frac{\omega(t)}{\rho(t) a(t)} \right) \left( \frac{\omega(t)}{\rho(t) a(t)} \right)^{\alpha+
\]
(3.7)

By virtue of Lemma 2.2, there exists a \( t_2 > t_1 \) such that, for \( t \geq t_2 \),
\[
\frac{z(\tau_1(t))}{b(\tau_1(t))z'(\tau_1(t))} \geq \frac{\int_{t_2}^{\tau_1(t)} \left( \frac{a(t)}{a(\omega(t))} du \right) ds}{\int_{t_1}^{t_2} \frac{a(t)}{a(\omega(t))} du}
\]
and
\[
\frac{b(\tau_1(t))z'(\tau_1(t))}{b(t)z'(t)} \geq \frac{\int_{t_1}^{\tau_1(t)} \frac{a(t)}{a(\omega(t))} du}{\int_{t_1}^{t_2} \frac{a(t)}{a(\omega(t))} du}.
\]

It follows now from (3.7) and the latter inequalities that
\[
\omega'(t) \leq \frac{\rho'(t)}{\rho(t)} \omega(t) - \rho(t) q_1(t) \left( \frac{\omega(t)}{\rho(t) a(t)} \right) \left( \frac{\omega(t)}{\rho(t) a(t)} \right)^{\alpha+
\]
(3.8)

Let
\[
y := \omega(t), \quad A := \frac{\alpha}{(\rho(t) a(t))^{1/\alpha}}, \quad \text{and} \quad B := \frac{\rho'(t)}{\rho(t)}.
\]
Using the inequality (see [16])

\[
B y - A y^{(\alpha+1)/\alpha} \leq \frac{\alpha^\alpha}{(\alpha + 1)^{\alpha+1}} \frac{B^{1+\alpha}}{A^\alpha}, \quad A > 0,
\]

we have

\[
\omega'(t) \omega(t) - \alpha \omega^{(\alpha+1)/\alpha}(t) \leq \frac{1}{(\alpha + 1)^{1+\alpha}} \frac{a(t)(\rho'_+(t))^{1+\alpha}}{\rho^\alpha(t)}.
\]

By (3.8), we deduce that

\[
\omega'(t) \leq -G(t) + \frac{1}{(\alpha + 1)^{1+\alpha}} \frac{a(t)(\rho'_+(t))^{1+\alpha}}{\rho^\alpha(t)}.
\]

Hence, there exists a \( t_3 > t_2 \) such that

\[
\int_{t_3}^{t} \left( G(s) - \frac{1}{(\alpha + 1)^{1+\alpha}} \frac{a(s)(\rho'_+(s))^{1+\alpha}}{\rho^\alpha(s)} \right) ds \leq \omega(t_3),
\]

which contradicts (3.1).

Assume now that case (II) holds for \( t \geq t_1 \). It follows from Lemma 2.3 that \( \lim_{t \to \infty} x(t) = 0 \). This completes the proof. \( \square \)

**Remark 3.2.** One can derive from Theorem 3.1 a number of asymptotic criteria for (1.1) with an appropriate choice of \( \rho(t) \). For example, we have the following result by letting \( \rho(t) = 1 \).

**Corollary 3.3.** Let conditions \((H_1)-(H_3)\) and (2.1) be satisfied. If for all sufficiently large \( t_1 \geq t_0 \) and for some \( t_3 > t_2 > t_1 \),

\[
\int_{t_3}^{\infty} G(t) dt = \infty,
\]

then the conclusion of Theorem 3.1 remains intact.

**Remark 3.4.** Theorem 3.1 extends [19, Theorem 2.1].

We provide the following example to illustrate the main results.

**Example 3.5.** For \( t \geq 1 \), consider a third-order neutral differential equation

\[
\left[ e^{-t} \left( x(t) + e^{-\pi} x(t - \pi) \right) \right]'' + (1 - e^{-2\pi}) \int_{-5\pi/2}^{\pi} e^{-1 - \xi} x(t + \xi) d\xi = 0. \tag{3.9}
\]

Let \( \rho(t) = t \). It is not difficult to verify that all assumptions of Theorem 3.1 are satisfied. Therefore, every solution \( x(t) \) of (3.9) is either oscillatory or satisfies \( \lim_{t \to \infty} x(t) = 0 \). In fact, \( x(t) = e^t \sin t \) is an oscillatory solution to this equation.
