Abstract

In this paper, we introduce one multistep relaxed implicit extragradient-like scheme and another multistep relaxed explicit extragradient-like scheme for finding a common element of the set of solutions of the minimization problem for a convex and continuously Fréchet differentiable functional, the set of solutions of a finite family of generalized mixed equilibrium problems and the set of solutions of a finite family of variational inequalities for inverse strongly monotone mappings in a real Hilbert space. Under suitable control conditions, we establish the strong convergence of these two multistep relaxed extragradient-like schemes to the same common element of the above three sets, which is also the unique solution of a variational inequality defined over the intersection of the above three sets. ©2017 All rights reserved.

Keywords: Convex minimization problem, generalized mixed equilibrium problem, variational inequality, inverse-strongly monotone mapping.

1. Introduction

Let $H$ be a real Hilbert space with inner product $\langle \cdot , \cdot \rangle$ and norm $\| \cdot \|$, $C$ be a nonempty closed convex subset of $H$ and $P_C$ be the metric projection of $H$ onto $C$. Let $T : C \to C$ be a self-mapping on $C$. We denote by $\text{Fix}(T)$ the set of fixed points of $T$ and by $\mathbb{R}$ the set of all real numbers. A mapping $A : H \to H$ is called $\gamma$-strongly positive on $H$, if there exists a constant $\gamma > 0$ such that

$$\langle Ax, x \rangle \geq \gamma \|x\|^2, \quad \forall x \in H.$$ 

A mapping $F : C \to H$ is called $L$-Lipschitz continuous, if there exists a constant $L \geq 0$ such that

$$\|Fx - Fy\| \leq L\|x - y\|, \quad \forall x, y \in C.$$

In particular, if \( L = 1 \) then \( F \) is called a nonexpansive mapping, if \( L \in [0, 1) \) then \( F \) is called a contraction. A mapping \( T : C \to C \) is called \( k \)-strictly pseudocontractive (or a \( k \)-strict pseudocontraction), if there exists a constant \( k \in [0, 1) \) such that
\[
\|Tx - Ty\| \leq \|x - y\| + k\|(I - T)x - (I - T)y\|^2, \quad \forall x, y \in C.
\]
In particular, if \( k = 0 \), then \( T \) is a nonexpansive mapping. The mapping \( T \) is pseudocontractive, if and only if
\[
\langle Tx - Ty, x - y \rangle \leq \|x - y\|^2, \quad \forall x, y \in C.
\]
\( T \) is strongly pseudocontractive, if and only if there exists a constant \( \lambda \in (0, 1) \) such that
\[
\langle Tx - Ty, x - y \rangle \leq \lambda \|x - y\|^2, \quad \forall x, y \in C.
\]

Let \( A : C \to H \) be a nonlinear mapping on \( C \). The variational inequality problem (VIP) associated with the set \( C \) and the mapping \( A \) is stated as follows: find \( x^* \in C \) such that
\[
\langle Ax^*, x - x^* \rangle \geq 0, \quad \forall x \in C. \tag{1.1}
\]
The solution set of VIP (1.1) is denoted by \( \text{VI}(C, A) \).

There are many applications of VIP (1.1) in various fields. In 1976, Korpelevich [18] proposed an iterative algorithm for solving VIP (1.1) in Euclidean space \( \mathbb{R}^n \):
\[
\begin{aligned}
 y_n &= P_C(x_n - \tau Ax_n), \\
x_{n+1} &= P_C(x_n - \tau A_y),
\end{aligned} \tag{1.2}
\]
with \( \tau > 0 \) a given number, which is known as the extragradient method. The literature on the VIP is vast and Korpelevich’s extragradient method has received great attention given by many authors, who improved it in various ways; see e.g., [7–9, 11, 13, 15, 21] and references therein.

On the other hand, let \( \varphi : C \to \mathbb{R} \) be a real-valued function, \( A : C \to H \) be a nonlinear mapping and \( \Theta : C \times C \to \mathbb{R} \) be a bifunction. In 2008, Peng and Yao [21] introduced the following generalized mixed equilibrium problem (GMEP) of finding \( x \in C \) such that
\[
\Theta(x, y) + \varphi(y) - \varphi(x) + \langle Ax, y - x \rangle \geq 0, \quad \forall y \in C. \tag{1.3}
\]
We denote the set of solutions of GMEP (1.3) by \( \text{GMEP}(\Theta, \varphi, A) \). The GMEP (1.3) is very general in the sense that it includes, as special cases, optimization problems, variational inequalities, minimax problems, Nash equilibrium problems in noncooperative games and others. The GMEP (1.3) contains GEP [8], MEP [14] and EP [27] as particular cases.

It was assumed in [21] that \( \Theta : C \times C \to \mathbb{R} \) is a bifunction satisfying conditions (A1)-(A4) and \( \varphi : C \to \mathbb{R} \) is a lower semicontinuous and convex function with restriction (B1) or (B2), where
\begin{enumerate}
(A1) \( \Theta(x, x) = 0 \), for all \( x \in C \);
(A2) \( \Theta \) is monotone, i.e., \( \Theta(x, y) + \Theta(y, x) \leq 0 \), for any \( x, y \in C \);
(A3) \( \Theta \) is upper-hemicontinuous, i.e., for each \( x, y, z \in C \),
\[
\limsup_{t \to 0^+} \Theta(tz + (1 - t)x, y) \leq \Theta(x, y);
\]
(A4) \( \Theta(x, \cdot) \) is convex and lower semicontinuous for each \( x \in C \);
(B1) for each \( x \in H \) and \( r > 0 \), there exists a bounded subset \( D_x \subset C \) and \( y_x \in C \) such that for any \( z \in C \setminus D_x \),
\[
\Theta(z, y_x) + \varphi(y_x) - \varphi(z) + \frac{1}{r} \langle y_x - z, z - x \rangle < 0;
\]
(B2) \( C \) is a bounded set.
Given a positive number \( r > 0 \), let \( T_r^{(\Theta, \varphi)} : H \to C \) be the solution set of the auxiliary mixed equilibrium problem, that is, for each \( x \in H \),
\[
T_r^{(\Theta, \varphi)}(x) := \{ y \in C : \Theta(y, z) + \varphi(z) - \varphi(y) + \frac{1}{r}(y - x, z - y) \geq 0, \forall z \in C \}.
\]
In particular, if \( \varphi \equiv 0 \) then \( T_r^{(\Theta, \varphi)} \) is rewritten as \( T_r^{\Theta} : H \to C \), i.e.,
\[
T_r^{\Theta}(x) := \{ y \in C : \Theta(y, z) + \frac{1}{r}(y - x, z - y) \geq 0, \forall z \in C \}.
\]
Furthermore, let \( f : C \to R \) be a convex and continuously Fréchet differentiable functional. Consider the convex minimization problem (CMP) of minimizing \( f \) over the constraint set \( C \)
\[
\min_{x \in C} f(x),
\]
(assuming the existence of minimizers). We denote by \( \Xi \) the set of minimizers of CMP (1.3).
Motivated and inspired by the above facts, we introduce one multistep relaxed implicit extragradient-like scheme and another multistep relaxed explicit extragradient-like scheme for finding a common element of the above three sets, which is also the unique solution of a variational inequality defined over the intersection of the above three sets. We also refer readers to \([1–3, 5, 6, 12, 16]\) and references therein for some more related papers published recently.

2. Preliminaries

Throughout this paper, we assume that \( H \) is a real Hilbert space whose inner product and norm are denoted by \( \langle \cdot, \cdot \rangle \) and \( \| \cdot \| \), respectively. Let \( C \) be a nonempty closed convex subset of \( H \). We write \( x_n \rightharpoonup x \) to indicate that the sequence \( \{x_n\} \) converges weakly to \( x \) and \( x_n \to x \) to indicate that the sequence \( \{x_n\} \) converges strongly to \( x \). Moreover, we use \( \omega_w(x_n) \) to denote the weak \( \omega \)-limit set of the sequence \( \{x_n\} \), i.e.,
\[
\omega_w(x_n) := \{ x \in H : x_n \rightharpoonup x \text{ for some subsequence } \{x_{n_i}\} \text{ of } \{x_n\} \}.
\]
The metric (or nearest point) projection from \( H \) onto \( C \) is the mapping \( P_C : H \to C \) which assigns to each point \( x \in H \) the unique point \( P_C x \in C \) satisfying the property
\[
\|x - P_C x\| = \inf_{y \in C} \|x - y\| =: d(x, C).
\]
The following properties of projections are useful and pertinent to our purpose.

**Proposition 2.1.** Given any \( x \in H \) and \( z \in C \), one has

(i) \( z = P_C x \iff \langle x - z, y - z \rangle \leq 0, \forall y \in C \);

(ii) \( z = P_C x \iff \|x - z\| \leq \|x - y\| - \|y - z\|, \forall y \in C \);

(iii) \( \langle P_C x - P_C y, x - y \rangle \geq \|P_C x - P_C y\|^2, \forall y \in H \), which hence implies that \( P_C \) is nonexpansive and monotone.

**Definition 2.2.** A mapping \( T : H \to H \) is said to be firmly nonexpansive, if \( 2T - I \) is nonexpansive, or equivalently if \( T \) is 1-inverse strongly monotone (1-ism),
\[
\langle x - y, Tx - Ty \rangle \geq \|Tx - Ty\|^2, \forall x, y \in H,
\]
alternatively, \( T \) is firmly nonexpansive, if and only if \( T \) can be expressed as
\[ T = \frac{1}{2}(I + S), \]

where \( S : H \to H \) is nonexpansive, projections are firmly nonexpansive.

**Definition 2.3.** A mapping \( F : C \to H \) is said to be

(i) monotone, if

\[ \langle Fx - Fy, x - y \rangle \geq 0, \quad \forall x, y \in C; \]

(ii) \( \eta \)-strongly monotone, if there exists a constant \( \eta > 0 \) such that

\[ \langle Fx - Fy, x - y \rangle \geq \eta \|x - y\|^2, \quad \forall x, y \in C; \]

(iii) \( \alpha \)-inverse-strongly monotone, if there exists a constant \( \alpha > 0 \) such that

\[ \langle Fx - Fy, x - y \rangle \geq \alpha \|Fx - Fy\|^2, \quad \forall x, y \in C. \]

It can be easily seen that if \( T \) is nonexpansive, then \( I - T \) is monotone. It is also easy to see that the projection \( P_C \) is 1-ism. Inverse strongly monotone (also referred to as co-coercive) operators have been applied widely in solving practical problems in various fields.

On the other hand, it is obvious that if \( F : C \to H \) is \( \alpha \)-inverse-strongly monotone, then \( F \) is monotone and \( \frac{1}{\alpha} \)-Lipschitz continuous. Moreover, we also have that, for all \( u, v \in C \) and \( \lambda > 0 \),

\[ \| (I - \lambda F)u - (I - \lambda F)v \|^2 \leq \| u - v \|^2 + \lambda(\lambda - 2\alpha)\| Fu - Fv \|^2. \]

So, if \( \lambda \leq 2\alpha \), then \( I - \lambda F \) is a nonexpansive mapping from \( C \) to \( H \).

Next we list some elementary conclusions for the MEP whose solution is denoted by MEP\((\Theta, \varphi)\).

**Proposition 2.4 ([14]).** Assume that \( \Theta : C \times C \to R \) satisfies (A1)-(A4) and let \( \varphi : C \to R \) be a proper lower semicontinuous and convex function. Assume that either (B1) or (B2) holds. For \( r > 0 \) and \( x \in H \), define a mapping \( T_r^{(\Theta, \varphi)} : H \to C \) as follows:

\[ T_r^{(\Theta, \varphi)}(x) = \{ z \in C : \Theta(z) + \varphi(y) - \varphi(z) + \frac{1}{r}\langle y - z, z - x \rangle \geq 0, \forall y \in C \}, \]

for all \( x \in H \). Then the following hold:

(i) for each \( x \in H \), \( T_r^{(\Theta, \varphi)}(x) \) is nonempty and single-valued;

(ii) \( T_r^{(\Theta, \varphi)} \) is firmly nonexpansive, that is, for any \( x, y \in H \),

\[ \| T_r^{(\Theta, \varphi)}x - T_r^{(\Theta, \varphi)}y \|^2 \leq \langle T_r^{(\Theta, \varphi)}x - T_r^{(\Theta, \varphi)}y, x - y \rangle; \]

(iii) \( \text{Fix}(T_r^{(\Theta, \varphi)}) = \text{MEP}(\Theta, \varphi) \);

(iv) \( \text{MEP}(\Theta, \varphi) \) is closed and convex;

(v) \( \| T_s^{(\Theta, \varphi)}x - T_t^{(\Theta, \varphi)}x \|^2 \leq \frac{s - t}{s} \langle T_s^{(\Theta, \varphi)}x - T_t^{(\Theta, \varphi)}x, T_s^{(\Theta, \varphi)}x - x \rangle, \) for all \( s, t > 0 \) and \( x \in H \).

**Definition 2.5.** A mapping \( T : H \to H \) is said to be an averaged mapping, if it can be written as the average of the identity \( I \) and a nonexpansive mapping, that is,

\[ T \equiv (1 - \alpha)I + \alpha S, \]

where \( \alpha \in (0, 1) \) and \( S : H \to H \) is nonexpansive. More precisely, when the last equality holds, we say that \( T \) is \( \alpha \)-averaged. Thus firmly nonexpansive mappings (in particular, projections) are \( \frac{1}{2} \)-averaged mappings.
**Definition 2.6** ([4]). Let \( S, T, V : H \to H \) be given operators.

(i) If \( T = (1 - \alpha)S + \alpha V \) for some \( \alpha \in (0, 1) \) and if \( S \) is averaged and \( V \) is nonexpansive, then \( T \) is averaged.

(ii) \( T \) is firmly nonexpansive, if and only if the complement \( I - T \) is firmly nonexpansive.

(iii) If \( T = (1 - \alpha)S + \alpha V \) for some \( \alpha \in (0, 1) \) and if \( S \) is firmly nonexpansive and \( V \) is nonexpansive, then \( T \) is averaged.

(iv) The composite of finitely many averaged mappings is averaged. That is, if each of the mappings \( \{T_i\}_{i=1}^N \) is averaged, then so is the composite \( T_1 \cdots T_N \). In particular, if \( T_1 \) is \( \alpha_1 \)-averaged and \( T_2 \) is \( \alpha_2 \)-averaged, where \( \alpha_1, \alpha_2 \in (0, 1) \), then the composite \( T_1T_2 \) is \( \alpha \)-averaged, where \( \alpha = \alpha_1 + \alpha_2 - \alpha_1\alpha_2 \).

(v) If the mappings \( \{T_i\}_{i=1}^N \) are averaged and have a common fixed point, then

\[
\bigcap_{i=1}^N \operatorname{Fix}(T_i) = \operatorname{Fix}(T_1 \cdots T_N).
\]

The notation \( \operatorname{Fix}(T) \) denotes the set of all fixed points of the mapping \( T \), that is, \( \operatorname{Fix}(T) = \{x \in H : Tx = x\} \).

We need some facts and tools in a real Hilbert space \( H \) which are listed as lemmas below.

**Lemma 2.7.** Let \( X \) be a real inner product space. Then there holds the following inequality

\[
\|x + y\|^2 \leq \|x\|^2 + 2\langle y, x + y \rangle, \quad \forall x, y \in X.
\]

**Lemma 2.8.** Let \( H \) be a real Hilbert space. Then the following hold:

(a) \( \|x - y\|^2 = \|x\|^2 - \|y\|^2 - 2\langle x - y, y \rangle \), for all \( x, y \in H \);

(b) \( \|\lambda x + \mu y\|^2 = \lambda\|x\|^2 + \mu\|y\|^2 - \lambda\mu\|x - y\|^2 \), for all \( x, y \in H \) and \( \lambda, \mu \in [0, 1] \) with \( \lambda + \mu = 1 \);

(c) If \( \{x_n\} \) is a sequence in \( H \) such that \( x_n \to x \), it follows that

\[
\limsup_{n \to \infty} \|x_n - y\|^2 = \limsup_{n \to \infty} \|x_n - x\|^2 + \|x - y\|^2, \quad \forall y \in H.
\]

It is clear that, in a real Hilbert space \( H \), \( T : C \to C \) is \( k \)-strictly pseudocontractive, if and only if the following inequality holds:

\[
\langle Tx - Ty, x - y \rangle \leq \|x - y\|^2 - \frac{1 - k}{2} \|(I - T)x - (I - T)y\|^2, \quad \forall x, y \in C.
\]

**Lemma 2.9** ([20, Proposition 2.1]). Let \( C \) be a nonempty closed convex subset of a real Hilbert space \( H \) and \( T : C \to C \) be a mapping.

(i) If \( T \) is a \( k \)-strictly pseudocontractive mapping, then \( T \) satisfies the Lipschitzian condition

\[
\|Tx - Ty\| \leq \frac{1 + k}{1 - k}\|x - y\|, \quad \forall x, y \in C.
\]

(ii) If \( T \) is a \( k \)-strictly pseudocontractive mapping, then the mapping \( I - T \) is semiclosed at 0, that is, if \( \{x_n\} \) is a sequence in \( C \) such that \( x_n \to \bar{x} \) and \( (I - T)x_n \to 0 \), then \( (I - T)\bar{x} = 0 \).

(iii) If \( T \) is \( k \)-(quasi-)strict pseudocontraction, then the fixed-point set \( \operatorname{Fix}(T) \) of \( T \) is closed and convex so that the projection \( P_{\operatorname{Fix}(T)} \) is well-defined.
Lemma 2.10 ([26]). Let $C$ be a nonempty closed convex subset of a real Hilbert space $H$. Let $T : C \to C$ be a $k$-strictly pseudocontractive mapping. Let $\gamma$ and $\delta$ be two nonnegative real numbers such that $(\gamma + \delta)k \leq \gamma$. Then
\[
\|\gamma(x - y) + \delta(Tx - Ty)\| \leq (\gamma + \delta)\|x - y\|, \quad \forall x, y \in C.
\]

Lemma 2.11 ([17, Demiclosedness principle]). Let $C$ be a nonempty closed convex subset of a real Hilbert space $H$. Let $S$ be a nonexpansive self-mapping on $C$. Then $I - S$ is demiclosed. That is, whenever $\{x_n\}$ is a sequence in $C$ weakly converging to some $x \in C$ and the sequence $\{(I - S)x_n\}$ strongly converges to some $y$, it follows that $(I - S)x = y$. Here $I$ is the identity operator of $H$.

Lemma 2.12. Let $A : C \to H$ be a monotone mapping. In the context of the variational inequality problem the characterization of the projection (see Proposition 2.1 (i)) implies
\[
u \in VI(C, A) \iff \nu = P_C(\nu - \lambda A\nu), \quad \lambda > 0.
\]

Let $C$ be a nonempty closed convex subset of a real Hilbert space $H$. We introduce some notations. Let $\lambda$ be a number in $[0, 1]$ and let $\mu > 0$. Associating with a nonexpansive mapping $T : C \to C$, we define the mapping $T^\lambda : C \to H$ by
\[
T^\lambda x := Tx - \lambda \mu F(Tx), \quad \forall x \in C,
\]
where $F : C \to H$ is an operator such that, for some positive constants $\kappa, \eta > 0$, $F$ is $\kappa$-Lipschitzian and $\eta$-strongly monotone on $C$, that is, $F$ satisfies the conditions:
\[
\|Fx - Fy\| \leq \kappa \|x - y\|, \quad \text{and} \quad \langle Fx - Fy, x - y \rangle \geq \eta \|x - y\|^2,
\]
for all $x, y \in C$.

Lemma 2.13 ([25, Lemma 3.1]). $T^\lambda$ is a contraction provided $0 < \mu < \frac{2\kappa}{\kappa + 1}$, that is,
\[
\|T^\lambda x - T^\lambda y\| \leq (1 - \lambda \tau)\|x - y\|, \quad \forall x, y \in C,
\]
where $\tau = 1 - \sqrt{1 - \mu(2\eta - \mu \kappa^2)} \in (0, 1)$.

Lemma 2.14 ([24, Lemma 2.1]). Let $\{a_n\}$ be a sequence of nonnegative real numbers satisfying
\[
a_{n+1} \leq (1 - \omega_n)a_n + \omega_n \delta_n + \tau_n, \quad \forall n \geq 0,
\]
where $\{\omega_n\}, \{\delta_n\}$ and $\{\tau_n\}$ satisfy the following conditions:
(i) $\{\omega_n\} \subset [0, 1]$ and $\sum_{n=0}^{\infty} \omega_n = \infty$;
(ii) either $\limsup_{n \to \infty} \delta_n \leq 0$ or $\sum_{n=0}^{\infty} \omega_n |\delta_n| < \infty$;
(iii) $\tau_n \geq 0$ for all $n \geq 0$, and $\sum_{n=1}^{\infty} \tau_n < \infty$.

Then, $\lim_{n \to \infty} a_n = 0$.

Lemma 2.15 ([19]). Assume that $A$ is a $\bar{\gamma}$-strongly positive bounded linear operator on $H$ with $0 < \rho \leq \|A\|^{-1}$. Then $\|1 - \rho A\| \leq 1 - \rho \bar{\gamma}$.

Let $\text{LIM}$ be a Banach limit. According to time and circumstances, we use $\text{LIM}_n a_n$ instead of $\text{LIM} a$ for every $a = \{a_n\} \in l^\infty$. The following properties are well-known:
(i) for all $n \geq 1$, $a_n \leq c_n$ implies $\text{LIM}_n a_n \leq \text{LIM}_n c_n$;
(ii) $\text{LIM}_n a_{n+N} = \text{LIM}_n a_n$ for any fixed positive integer $N$;
(iii) $\liminf_{n \to \infty} a_n \leq \text{LIM}_n a_n \leq \limsup_{n \to \infty} a_n$ for all $\{a_n\} \in l^\infty$. 
Lemma 2.16. Let $a \in \mathbb{R}$ be a real number and let a sequence $\{a_n\} \in l^\infty$ satisfy the condition $\lim_{n \to \infty} a_n \leq a$ for all Banach limit $\lim$. If $\lim sup_{n \to \infty} (a_{n+1} - a_n) \leq 0$, then $\lim sup_{n \to \infty} a_n \leq a$.

Recall that a set-valued mapping $\tilde{T} : D(\tilde{T}) \subset H \to 2^H$ is called monotone, if for all $x, y \in D(\tilde{T})$, $f \in \tilde{T}x$ and $g \in \tilde{T}y$ imply

$$\langle f - g, x - y \rangle \geq 0.$$  

A set-valued mapping $\tilde{T}$ is called maximal monotone, if $\tilde{T}$ is monotone and $(I + \lambda \tilde{T})D(\tilde{T}) = H$ for each $\lambda > 0$, where $I$ is the identity mapping of $H$. We denote by $G(\tilde{T})$ the graph of $\tilde{T}$. It is known that a monotone mapping $\tilde{T}$ is maximal, if and only if for $(x, f) \in H \times H$, $\langle f - g, x - y \rangle \geq 0$ for every $(y, g) \in G(\tilde{T})$ implies $f \in \tilde{T}x$. Next we provide an example to illustrate the concept of maximal monotone mapping.

Let $A : C \to H$ be a monotone and Lipschitz-continuous mapping and let $N_{C}v$ be the normal cone to $C$ at $v \in C$, i.e.,

$$N_{C}v = \{u \in H : \langle v - p, u \rangle \geq 0, \forall p \in C\}.$$  

Define

$$\tilde{T}v = \begin{cases} Av + N_{C}v, & \text{if } v \in C, \\ \emptyset, & \text{if } v \not\in C. \end{cases}$$  

Then, it is known in [22] that $\tilde{T}$ is maximal monotone and $0 \in \tilde{T}v$ if and only if $v \in VI(C, A)$.

3. Main results

Let $C$ be a nonempty closed convex subset of a real Hilbert space $H$ and let $M, N$ be two integers. Throughout this section, we always assume the following:

- $F : C \to H$ is a $\kappa$-Lipschitzian and $\eta$-strongly monotone operator with positive constants $\kappa, \eta > 0$, and $f : C \to \mathbb{R}$ is a convex functional with $L$-Lipschitz continuous gradient $\nabla f$;
- $A_i : C \to H$ is $\eta_i$-inverse strongly monotone for each $i = 1, \cdots, N$, and $B_j : C \to H$ is $\mu_j$-inverse strongly monotone for each $j = 1, \cdots, M$;
- $A$ is a $\gamma$-strongly positive bounded linear operator on $H$ with $\gamma \in (1, 2)$ and $V : C \to H$ is an $L$-Lipschitzian mapping with $L \geq 0$;
- $\theta_j : C \times C \to \mathbb{R}$ is a bifunction satisfying conditions (A1)-(A4) and $q_j : C \to \mathbb{R} \cup (+\infty)$ is a proper lower semicontinuous and convex function with restrictions (B1) or (B2) for each $j = 1, \cdots, M$;
- $0 < \mu < \frac{2n}{\kappa}$ and $0 \leq \gamma l < \tau$ with $\tau = 1 - \sqrt{1 - \mu(2\eta - \mu\kappa^2)}$;
- $P_C(1 - \lambda t \nabla f) = s_t 1 + (1 - s_t)T_t$, where $T_t$ is nonexpansive, $s_t = \frac{2 - \lambda t}{4} \in (0, \frac{1}{2})$ and $\lambda t : (0, 1) \to (0, \frac{2}{L})$ with $\lim_{t \to 0} \lambda_t = \frac{2}{L}$;
- $P_C(1 - \lambda n \nabla f) = s_n 1 + (1 - s_n)T_n$, where $T_n$ is nonexpansive, $s_n = \frac{2 - \lambda n}{4} \in (0, \frac{1}{2})$ and $\{\lambda_n\} \subset (0, \frac{2}{L})$ with $\lim_{n \to \infty} \lambda_n = \frac{2}{L}$;
- $A^N_i : C \to C$ is a mapping defined by $A^N_i x = P_C(1 - \lambda_i, n A_n) \cdots P_C(1 - \lambda_i, A_1) x, t \in (0, 1)$, for $\{\lambda_i, n\} \subset [a_i, b_i] \subset (0, 2\eta_i), i = 1, \cdots, N$;
- $A^M_i : C \to C$ is a mapping defined by $A^M_i x = P_C(1 - \lambda_i, n A_n) \cdots P_C(1 - \lambda_i, A_1) x$ with $\{\lambda_i, n\} \subset [a_i, b_i] \subset (0, 2\eta_i)$ and $\lim_{n \to \infty} \lambda_i = \lambda_i$ for each $i = 1, \cdots, N$;
- $\Delta^M_i : C \to C$ is a mapping defined by $\Delta^M_i x = \tau^{(\theta_j, \phi_j)}_i (I - \tau M_i B_i) \cdots \tau^{(\theta_j, \phi_j)}_1 (I - \tau I B_1) x, t \in (0, 1)$, for $\{\tau_i, t\} \subset [c_j, d_j] \subset (0, 2\mu_j), j = 1, \cdots, M$. 

The following lemma was given in [23, Proposition 2].
Theorem 3.1. Let \( \{x_t\} \) be defined via (3.1). Then
(i) \( \{x_t\} \) is bounded for \( t \in (0, \min(1, \frac{2-\gamma}{\tau-\gamma})) \);

(ii) \( \lim_{t \to 0} \|x_t - T_t x_t\| = 0 \), \( \lim_{t \to 0} \|x_t - \Delta^N x_t\| = 0 \) and \( \lim_{t \to 0} \|x_t - \Delta^M x_t\| = 0 \) provided \( \lim_{t \to 0} \lambda_t = \frac{2}{\tau} \) (\( \Leftrightarrow \lim_{t \to 0} s_t = 0 \));

(iii) \( x_t : (0, \min(1, \frac{2-\gamma}{\tau-\gamma})) \to \mathbb{H} \) is locally Lipschitzian provided \( s_t : (0, \min(1, \frac{2-\gamma}{\tau-\gamma})) \to (0, \min(\frac{1}{2\gamma}, \|A\|^{-1})) \) is locally Lipschitzian, \( \lambda_{t, i} : (0, \min(1, \frac{2-\gamma}{\tau-\gamma})) \to [a_i, b_i] \) is locally Lipschitzian for each \( i = 1, \cdots, N \) and \( r_{j, t} : (0, \min(1, \frac{2-\gamma}{\tau-\gamma})) \to [c_j, d_j] \) is locally Lipschitzian for each \( j = 1, \cdots, M \);

(iv) \( x_t \) defines a continuous path from \( (0, \min(1, \frac{2-\gamma}{\tau-\gamma})) \) into \( \mathbb{H} \) provided

\[
\begin{align*}
& s_t : (0, \min(1, \frac{2-\gamma}{\tau-\gamma})) \to (0, \min(\frac{1}{2\gamma}, \|A\|^{-1})) \\
& \lambda_{t, i} : (0, \min(1, \frac{2-\gamma}{\tau-\gamma})) \to [a_i, b_i] \text{ is continuous for each } i = 1, \cdots, N, \text{ and} \\
& r_{j, t} : (0, \min(1, \frac{2-\gamma}{\tau-\gamma})) \to [c_j, d_j] \text{ is continuous for each } j = 1, \cdots, M.
\end{align*}
\]

We prove the following theorem for strong convergence of the net \( \{x_t\} \) as \( t \to 0 \), which guarantees the existence of solutions of the variational inequality (3.2).

**Theorem 3.2.** Let the net \( \{x_t\} \) be defined via (3.1). If \( \lim_{t \to 0} s_t = 0 \), then \( x_t \) converges strongly to a point \( \bar{x} \in \Omega \) as \( t \to 0 \), which solves the VIP (3.2). Equivalently, we have \( P_\Omega(2I - A)\bar{x} = \bar{x} \).

**Proof.** We first note that we have the uniqueness of solutions of the VIP (3.2) which is indeed a consequence of the strong monotonicity of \( A - I \).

Next, we prove that \( x_t \to \bar{x} \) as \( t \to 0 \). Observing \( \operatorname{Fix}(T_t) = \mathbb{Z} \), from (3.1) we write for given \( p \in \Omega \),

\[
x_t - p = x_t - w_t + w_t - p \\
= x_t - w_t + (1 - s_t A)T_t v_t + s_t (\gamma Vx_t + (1 - t\mu F)T_t v_t) - p \\
= x_t - w_t + (1 - s_t A)(T_t v_t - T_t p) + s_t (\gamma Vx_t + (1 - t\mu F)T_t v_t - p) + s_t (I - A)p \\
= x_t - w_t + (1 - s_t A)(T_t v_t - T_t p) + s_t (\gamma Vx_t + (1 - t\mu F)T_t v_t - p) \\
+ s_t (I - A)p,
\]

where \( w_t = (1 - s_t A)T_t v_t + s_t (\gamma Vx_t + (1 - t\mu F)T_t v_t) \). Then, by Proposition 2.1 (i), we have

\[
\begin{align*}
\|x_t - p\|^2 &= \langle x_t - w_t, x_t - p \rangle + \langle (1 - s_t A)(T_t v_t - T_t p), x_t - p \rangle + s_t \langle \gamma Vx_t - \mu Fp, x_t - p \rangle \\
&\quad + \langle (1 - t\mu F)T_t v_t - (1 - t\mu F)p, x_t - p \rangle + s_t \langle (I - A)p, x_t - p \rangle \\
&\leq (1 - s_t \gamma)\|x_t - p\|^2 + s_t \| (I - t\tau)\|x_t - p\|^2 + t\gamma \|x_t - p\|^2 \\
&\quad + s_t \langle \gamma V - \mu Fp, x_t - p \rangle + s_t \| (I - A)p, x_t - p \rangle + s_t \| (I - A)p, x_t - p \rangle.
\end{align*}
\]

Therefore,

\[
\|x_t - p\|^2 \leq \frac{1}{\gamma - 1 + t(\tau - \gamma)} \langle t(\gamma V - \mu F)p, x_t - p \rangle + \langle (I - A)p, x_t - p \rangle. \tag{3.4}
\]

Since the net \( \{x_t\} \) is bounded (due to Proposition 3.1 (i)), we know that if \( \{t_n\} \) is a subsequence in \( (0, \min(1, \frac{2-\gamma}{\tau-\gamma})) \) such that \( t_n \to 0 \) and \( x_{t_n} \to x^* \), then from (3.4), we obtain \( x_{t_n} \to x^* \). Let us show that \( x^* \in \Omega \). Indeed, by Proposition 3.1 (ii), we know that \( \lim_{n \to \infty} \|x_{t_n} - T_{t_n} x_{t_n}\| = 0 \). Observe that

\[
\|P_C(I - \lambda_{t_n} \nabla f)x_{t_n} - x_{t_n}\| = \|s_{t_n} x_{t_n} + (1 - s_{t_n})T_{t_n} x_{t_n} - x_{t_n}\| \\
= (1 - s_{t_n})\|T_{t_n} x_{t_n} - x_{t_n}\| \\
\leq \|T_{t_n} x_{t_n} - x_{t_n}\|.
\]
where $s_{tn} = \frac{2 - \lambda_{tn}}{4} \in (0, \frac{1}{2})$, for $\lambda_{tn} \in (0, \frac{2}{L})$. Hence we have

$$
\|P_C(I - \frac{2}{L} \nabla f)x_{tn} - x_{tn}\| \leq \|P_C(I - \frac{2}{L} \nabla f)x_{tn} - P_C(I - \lambda_{tn} \nabla f)x_{tn}\| + \|P_C(I - \lambda_{tn} \nabla f)x_{tn} - x_{tn}\|
$$

$$
\leq \|((I - \frac{2}{L} \nabla f)x_{tn} - (I - \lambda_{tn} \nabla f)x_{tn})\| + \|P_C(I - \lambda_{tn} \nabla f)x_{tn} - x_{tn}\|
$$

$$
\leq (2 - \lambda_{tn})\|\nabla f(x_{tn})\| + \|T_{tn}x_{tn} - x_{tn}\|.
$$

From the boundedness of $\{x_{tn}\}, s_{tn} \to 0$ ($\iff \lambda_{tn} \to \frac{2}{L}$) and $\|T_{tn}x_{tn} - x_{tn}\| \to 0$, it follows that

$$
\|x^* - P_C(I - \frac{2}{L} \nabla f)x^*\| = \lim_{n \to \infty} \|x_{tn} - P_C(I - \frac{2}{L} \nabla f)x_{tn}\| = 0.
$$

So, $x^* \in VI(C, \nabla f) = \Xi$.

Furthermore, it can be shown that $\Delta_{tn}^j x_{tn} \to x^*$, $\Lambda_{tn}^m u_{tn} \to x^*$, $u_{tn} \to x^*$ and $v_{tn} \to x^*$ where $j \in \{1, \cdots, M\}, m \in \{1, \cdots, N\}$. Let

$$
\widetilde{T}_m v = \begin{cases} A_m v + N_C v, & v \in C, \\
0, & v \not\in C,
\end{cases}
$$

where $m \in \{1, \cdots, N\}$. By a standard argument, we can show that

$$
(v - x^*, u) \geq 0.
$$

Since $\widetilde{T}_m$ is maximal monotone, we have $x^* \in \widetilde{T}_m^{-1}(0)$ and hence $x^* \in VI(C, A_m), m = 1, 2, \cdots, N$, which implies $x^* \in \cap_{m=1}^N VI(C, A_m)$. Next we prove that $x^* \in \cap_{j=1}^M \text{GMEP}(\Theta_j, \varphi_j, B_j)$. Since $\Delta_{tn}^j x_{tn} = T_{r_{j, tn}}^{(2)} \cap (I - r_{j, tn} B_j) \Delta_{tn}^{j-1} x_{tn}, j \in \{1, \cdots, M\}$, we have

$$
\Theta_j(\Delta_{tn}^j x_{tn}, y) - \varphi_j(\Delta_{tn}^j x_{tn}) + \langle B_j \Delta_{tn}^{j-1} x_{tn}, y - \Delta_{tn}^j x_{tn}\rangle + (y - \Delta_{tn}^j x_{tn}, \frac{\Delta_{tn}^j x_{tn} - \Delta_{tn}^{j-1} x_{tn}}{r_{j, tn}}) \geq 0.
$$

By (A2), we have

$$
\varphi_j(y) - \varphi_j(\Delta_{tn}^j x_{tn}) + \langle B_j \Delta_{tn}^{j-1} x_{tn}, y - \Delta_{tn}^j x_{tn}\rangle + (y - \Delta_{tn}^j x_{tn}, \frac{\Delta_{tn}^j x_{tn} - \Delta_{tn}^{j-1} x_{tn}}{r_{j, tn}}) \geq \Theta_j(y, \Delta_{tn}^j x_{tn}).
$$

Let $z_t = ty + (1 - t)x^*$ for all $t \in (0, 1]$ and $y \in C$. This implies that $z_t \in C$. Then, we have

$$
\langle z_t - \Delta_{tn}^j x_{tn}, B_j z_t\rangle \geq \varphi_j(\Delta_{tn}^j x_{tn}) - \varphi_j(z_t) + \langle z_t - \Delta_{tn}^j x_{tn}, B_j z_t\rangle - \langle z_t - \Delta_{tn}^j x_{tn}, B_j \Delta_{tn}^{j-1} x_{tn}\rangle
$$

$$
- \langle z_t - \Delta_{tn}^j x_{tn}, \frac{\Delta_{tn}^j x_{tn} - \Delta_{tn}^{j-1} x_{tn}}{r_{j, tn}}\rangle + \Theta_j(z_t, \Delta_{tn}^j x_{tn})
$$

$$
= \varphi_j(\Delta_{tn}^j x_{tn}) - \varphi_j(z_t) + \langle z_t - \Delta_{tn}^j x_{tn}, B_j z_t - B_j \Delta_{tn}^j x_{tn}\rangle
$$

$$
+ \langle z_t - \Delta_{tn}^j x_{tn}, B_j \Delta_{tn}^{j-1} x_{tn} - B_j \Delta_{tn}^{j-1} x_{tn}\rangle - \langle z_t - \Delta_{tn}^j x_{tn}, \frac{\Delta_{tn}^j x_{tn} - \Delta_{tn}^{j-1} x_{tn}}{r_{j, tn}}\rangle
$$

$$
+ \Theta_j(z_t, \Delta_{tn}^j x_{tn}).
$$

Note that $\|B_j \Delta_{tn}^j x_{tn} - B_j \Delta_{tn}^{j-1} x_{tn}\| \to 0$ as $n \to \infty$. Furthermore, by the monotonicity of $B_j$, we obtain

$$
\langle z_t - \Delta_{tn}^j x_{tn}, B_j z_t - B_j \Delta_{tn}^j x_{tn}\rangle \geq 0. \text{ Then, by (A4) we obtain}
$$

$$
\langle z_t - x^*, B_j z_t\rangle \geq \varphi_j(x^*) - \varphi_j(z_t) + \Theta_j(z_t, x^*).
$$

(3.5)
Utilizing (A1), (A4) and (3.5), we obtain
\[
0 = \Theta_j(z_t, z_t) + \varphi_j(z_t) - \varphi_j(z_t) \\
\leq t \Theta_j(z_t, y) + (1 - t) \Theta_j(z_t, x^*) + t \varphi_j(y) + (1 - t) \varphi_j(x^*) - \varphi_j(z_t) \\
\leq t(\Theta_j(z_t, y) + \varphi_j(y) - \varphi_j(z_t)) + (1 - t)(z_t - x^*, B_j z_t) \\
= t(\Theta_j(z_t, y) + \varphi_j(y) - \varphi_j(z_t)) + (1 - t)(y - x^*, B_j z_t),
\]
and hence
\[
0 \leq \Theta_j(z_t, y) + \varphi_j(y) - \varphi_j(z_t) + (1 - t)(y - x^*, B_j z_t).
\]
Letting \( t \to 0 \), we have for each \( y \in C \),
\[
0 \leq \Theta_j(x^*, y) + \varphi_j(y) - \varphi_j(x^*) + \langle y - x^*, B_j x^* \rangle.
\]
This implies that \( x^* \in \text{GMEP}(\Theta_j, \varphi, B_j) \) and hence \( x^* \in \cap_{j=1}^M \text{GMEP}(\Theta_j, \varphi, B_j). \) Therefore,
\[
x^* \in \cap_{j=1}^M \text{GMEP}(\Theta_j, \varphi, B_j) \cap \cap_{i=1}^N \text{VI}(C, A_i) \cap \Xi =: \Omega.
\]

Next, we prove that \( x_t \to \bar{x} \) as \( t \to 0 \). First, let us assert that \( x^* \) is a solution of the VIP (3.2). As a matter of fact, since
\[
x_t = x_t - w_t + (1 - s_t A_t)T_t A_t^N A_t^M x_t + s_t(\gamma V x_t + (1 - t \mu F)T_t A_t^N A_t^M x_t),
\]
we have
\[
x_t - T_t A_t^N A_t^M x_t = x_t - w_t + s_t((1 - A_t)T_t A_t^N A_t^M x_t + s_t(\gamma V x_t - \mu F T_t A_t^N A_t^M x_t).
\]
Since \( T_t, A_t^N \) and \( A_t^M \) are nonexpansive mappings, \( 1 - T_t A_t^N A_t^M \) is monotone. So from the monotonicity of \( 1 - T_t A_t^N A_t^M \), it follows that, for \( p \in \Omega, \)
\[
0 \leq \langle (1 - T_t A_t^N A_t^M)x_t - (1 - T_t A_t^N A_t^M)p, x_t - p \rangle = \langle (1 - T_t A_t^N A_t^M)x_t, x_t - p \rangle \\
= \langle x_t - w_t, x_t - p \rangle + s_t(\langle (1 - A_t)T_t A_t^N A_t^M x_t, x_t - p \rangle + s_t(\gamma V x_t - \mu F T_t A_t^N A_t^M x_t, x_t - p) \\
\leq s_t(\langle (1 - A_t)T_t A_t^N A_t^M x_t, x_t - p \rangle + s_t(\gamma V x_t - \mu F T_t A_t^N A_t^M x_t, x_t - p) \\
= s_t(\langle (1 - A_t)x_t, x_t - p \rangle + s_t(\langle (1 - A_t)(T_t A_t^N A_t^M - I)x_t, x_t - p \rangle \\
+ s_t(\gamma V x_t - \mu F T_t A_t^N A_t^M x_t, x_t - p).\]
This implies that
\[
\langle (A - I)x_t, x_t - p \rangle \leq \langle (A - I)(T_t A_t^N A_t^M - I)x_t, x_t - p \rangle + t(\gamma V x_t - \mu F T_t A_t^N A_t^M x_t, x_t - p).
\]
That is,
\[
\langle (A - I)x_t, x_t - p \rangle \leq \langle (A - I)(T_t v_t - x_t), x_t - p \rangle + t(\gamma V x_t - \mu F T_t v_t, x_t - p). \tag{3.6}
\]
Now, replacing \( t \) in (3.6) with \( t_n \) and letting \( n \to \infty \), noticing the boundedness of \( \{\gamma V x_{t_n} - \mu F T_{t_n} v_{t_n}\} \) and the fact that \( (I - A)(T_{t_n} v_{t_n} - x_{t_n}) \to 0 \) as \( n \to \infty \), we obtain
\[
\langle (A - I)x^*, x^* - p \rangle \leq 0.
\]
That is, \( x^* \in \Omega \) is a solution of the VIP (3.2), hence \( x^* = \bar{x} \) by uniqueness. In summary, we have proven that each cluster point of \( \{x_t\} \) (as \( t \to 0 \)) equals \( \bar{x} \). Consequently, \( x_t \to \bar{x} \) as \( t \to 0. \)
Theorem 3.3. Let \( \{x_n\} \) be the sequence generated by the explicit scheme (3.3), where \( \{\alpha_n\} \) and \( \{s_n\} \) satisfy the following condition:

(C1) \( \{\alpha_n\} \subset [0,1], \{s_n\} \subset (0,\frac{1}{2}) \) and \( \alpha_n \to 0, s_n \to 0 \) as \( n \to \infty \).

Let \( \text{LIM} \) be a Banach limit. Then

\[
\text{LIM}_n((A - I)x, x - x_n) \leq 0,
\]

where \( \bar{x} = \lim_{t \to 0^+} x_t \) with \( x_t \) being defined by

\[
x_t = P_C([I - s_tA]T\Lambda^N\Delta^Mx_t + s_t(\gamma Vx_t + (I - t\mu F)T\Lambda^N\Delta^Mx_t)],
\]

where \( T, \Lambda^N, \Delta^M : C \to C \) are defined by

\[
Tx = P_C((I - \frac{2}{I} \nabla f)x,
\]

\[
\Lambda^N x = P_C((I - \Lambda_N A_N) \cdots P_C((I - \Lambda_1 A_1)x)
\]

and

\[
\Delta^M x = T_{r_M}^{\Theta_M}(I - r_M B_M) \cdots T_{r_1}^{\Theta_1}(I - r_1 B_1)x,
\]

for \( \lambda_i \in [a_i, b_i] \subset (0,2\eta_i), i = 1, \cdots, N \) and \( r_j \in [c_j, d_j] \subset (0,2\mu_j), j = 1, \cdots, M \).

Proof. First, note that from the condition (C1), without loss of generality, we may assume that \( 0 < s_n \leq \frac{1}{|A|} \) for all \( n \geq 0 \). Let \( \{x_t\} \) be the net generated by (3.7). Since \( T, \Lambda^N \) and \( \Delta^M \) are nonexpansive self-mappings on \( C \), by Theorem 3.2 with \( T_t = T, \Lambda^N_t = \Lambda^N \) and \( \Delta^M_t = \Delta^M \), there exists \( \lim_{t \to 0} x_t \in \Omega \). Denote it by \( \bar{x} \). Moreover, \( \bar{x} \) is the unique solution of the VIP (3.2). From Proposition 3.1 (i) with \( T_t = T, \Lambda^N_t = \Lambda^N \) and \( \Delta^M_t = \Delta^M \), we know that \( \{x_t\} \) is bounded and so are the nets \( \{Vx_t\}, \{\Delta^M x_t\}, \{\Lambda^N \Delta^M x_t\} \) and \( \{FT\Lambda^N \Delta^M x_t\} \).

First of all, let us show that \( \{x_n\} \) is bounded. To this end, take \( p \in \Omega \). Then we get

\[
\|y_n - p\| = \|\alpha_n\gamma Vx_n + (1 - \alpha_n \mu F)T_n \Lambda^N_n \Delta^M_n x_n - p\|
\]

\[
= \|\alpha_n(\gamma Vx_n - \mu F)p + (1 - \alpha_n \mu F)T_n \Lambda^N_n \Delta^M_n x_n - (1 - \alpha_n \mu F)T_n \Lambda^N_n \Delta^M_n p\|
\]

\[
\leq \alpha_n \gamma |\|x_n - p\| + \alpha_n(\|\gamma V - \mu F\|p\| + (1 - \alpha_n)\|x_n - p\|)
\]

\[
= (1 - \alpha_n(\gamma - \mu)\|x_n - p\| + \alpha_n(\|\gamma V - \mu F\|p\|),
\]

which together with Lemma 2.15, implies that

\[
\|x_{n+1} - p\| = \|P_C([I - s_n A]T_n \Lambda^N_n \Delta^M_n x_{n+1} + s_n y_{n+1}) - p\|
\]

\[
\leq \|(I - s_n A)T_n \Lambda^N_n \Delta^M_n x_{n+1} + \beta_n y_{n+1} - p\|
\]

\[
\leq \|(I - s_n A)T_n \Lambda^N_n \Delta^M_n x_n - (1 - s_n A)T_n \Lambda^N_n \Delta^M_n p + s_n(y_n - p) + s_n(I - A)p\|
\]

\[
\leq \|(I - s_n A)T_n \Lambda^N_n \Delta^M_n x_n - (1 - s_n A)T_n \Lambda^N_n \Delta^M_n p\| + s_n\|y_n - p\| + s_n\|I - A\|\|p\|
\]

\[
\leq (1 - s_n(\gamma - 1))\|x_n - p\| + s_n(\|\gamma V - \mu F\|p\| + \|I - A\|\|p\|)
\]

\[
= (1 - s_n(\gamma - 1))\|x_n - p\| + s_n(\gamma - 1)\frac{\|\gamma V - \mu F\|p\| + \|I - A\|\|p\|}{\gamma - 1}
\]

\[
\leq \max\{\|x_n - p\|, \|\gamma V - \mu F\|p\| + \|I - A\|\|p\|, \gamma - 1\}
\]

By induction

\[
\|x_n - p\| \leq \max\{\|x_0 - p\|, \frac{\|\gamma V - \mu F\|p\| + \|I - A\|\|p\|}{\gamma - 1}\}, \forall n \geq 0.
\]
This implies that \( \{x_n\} \) is bounded and so are \( \{Vx_n\}, \{u_n\}, \{v_n\}, \{FT_nv_n\} \) and \( \{y_n\} \). Thus, utilizing the control condition (C1), we get
\[
\|x_{n+1} - T_nv_n\| = \|P_C[(I - s_nA)T_nv_n + s_ny_n - T_nv_n]\|
\leq \|(I - s_nA)T_nv_n + s_ny_n - T_nv_n\|
= s_n\|y_n - AT_nv_n\| \to 0 \quad \text{as} \quad n \to \infty.
\]

One can show that
\[
\|T\Lambda^N\Delta^Mx_n - T_n\Lambda^N\Delta^Mx_n\| \leq \|\Lambda^N\Delta^Mx_n - \Lambda_n^N\Delta_n^Mx_n\| + \tilde{M}\frac{2}{L} - \lambda_n, \tag{3.8}
\]
where \( \sup_{n \geq 0}(L\|P_C(1 - \frac{2}{L}\nabla f)v_n\| + 4\|\nabla f(v_n)\| + L\|v_n\|) \leq \tilde{M} \) for some \( \tilde{M} > 0 \). Also it is not difficult to derive that
\[
\|\Lambda^N\Delta^Mx_n - \Lambda_n^N\Delta_n^Mx_n\| \leq \tilde{M}_0 \sum_{i=1}^{N} |\lambda_i - \lambda_{i,n}| + \|\Delta^Mx_n - \Delta_n^Mx_n\|, \tag{3.9}
\]
where \( \sup_{n \geq 0}(\sum_{i=1}^{N} |\Lambda_i\Lambda^{-1}\Delta^Mx_n|) \leq \tilde{M}_0 \) for some \( \tilde{M}_0 > 0 \). Observe that
\[
\|\Delta^Mx_n - \Delta_n^Mx_n\| \leq \tilde{M}_1 \sum_{j=1}^{M} |r_j - r_{j,n}|, \tag{3.10}
\]
where \( \sup_{n \geq 0}(\sum_{i=1}^{M} \|B_i\Delta^{j-1}x_n\| + \frac{1}{\epsilon} \|T_{i}(\Theta, \varphi) (I - r_jB_j)\Delta^{j-1}x_n - (I - r_jB_j)\Delta^{j-1}x_n\|) \leq \tilde{M}_1 \) for some \( \tilde{M}_1 > 0 \). In terms of (3.8), (3.9), (3.10) we calculate
\[
\|T\Lambda^N\Delta^Mx_n - T_n\Lambda^N\Delta^Mx_n\| \leq \|\Lambda^N\Delta^Mx_n - \Lambda_n^N\Delta_n^Mx_n\| + \tilde{M}\frac{2}{L} - \lambda_n
\leq \|\Delta^Mx_n - \Delta_n^Mx_n\| + \tilde{M}_0 \sum_{i=1}^{N} |\lambda_i - \lambda_{i,n}| + \tilde{M}\frac{2}{L} - \lambda_n
\leq \tilde{M}_1 \sum_{j=1}^{M} |r_j - r_{j,n}| + \tilde{M}_0 \sum_{i=1}^{N} |\lambda_i - \lambda_{i,n}| + \tilde{M}\frac{2}{L} - \lambda_n.
\]

Consequently, it is not hard to find that
\[
\|T\Lambda^N\Delta^Mx_t - x_{n+1}\| \leq \|T\Lambda^N\Delta^Mx_t - T\Lambda^N\Delta^Mx_n\|
+ \|T\Lambda^N\Delta^Mx_n - T_n\Lambda^N\Delta^Mx_n\| + \|T_nv_n - x_{n+1}\|
\leq \|x_t - x_n\| + \tilde{M}_1 \sum_{j=1}^{M} |r_j - r_{j,n}| + \tilde{M}_0 \sum_{i=1}^{N} |\lambda_i - \lambda_{i,n}| + \tilde{M}\frac{2}{L} - \lambda_n
+ \|T_nv_n - x_{n+1}\|
\leq \|x_t - x_n\| + \epsilon_n,
\]
where \( \epsilon_n = \tilde{M}_1 \sum_{j=1}^{M} |r_j - r_{j,n}| + \tilde{M}_0 \sum_{i=1}^{N} |\lambda_i - \lambda_{i,n}| + \tilde{M}\frac{2}{L} - \lambda_n + \|T_nv_n - x_{n+1}\| \to 0 \) as \( n \to \infty \). Also observing that \( A \) is strongly positive, we have
\[
\langle Ax_t - Ax_n, x_t - x_n \rangle = \langle A(x_t - x_n), x_t - x_n \rangle \geq \gamma \|x_t - x_n\|^2. \tag{3.12}
\]
For simplicity, we write \( w_t = (I - s_tA)T\Lambda^N\Delta^Mx_t + s_t(t\gamma Vx_t + (I - t\mu F)T\Lambda^N\Delta^Mx_t) \). Then we obtain that \( x_t = P_Cw_t \) and
\[ x_{t} - x_{n+1} = x_{t} - w_{t} + (1 - s_{t}A)\mathcal{T}A^{N}A^{M}x_{t} + s_{t}(\gamma Vx_{t} + (1 - \mu F)\mathcal{T}A^{N}A^{M}x_{t}) - x_{n+1} \]
\[ = (1 - s_{t}A)\mathcal{T}A^{N}A^{M}x_{t} - (1 - s_{t}A)x_{n+1} + s_{t}(\gamma Vx_{t} + (1 - \mu F)\mathcal{T}A^{N}A^{M}x_{t} - Ax_{n+1}) + x_{t} - w_{t}. \]

Applying Lemma 2.7, we have
\[
\|x_{t} - x_{n+1}\|^2 \leq \|(1 - s_{t}A)\mathcal{T}A^{N}A^{M}x_{t} - (1 - s_{t}A)x_{n+1}\|^2 \\
+ 2s_{t}\langle \mathcal{T}A^{N}A^{M}x_{t} - t(\mu FT\mathcal{T}A^{N}A^{M}x_{t} \gamma Vx_{t}) - Ax_{n+1}, x_{t} - x_{n+1} \rangle \\
\leq \|(1 - s_{t}A)\mathcal{T}A^{N}A^{M}x_{t} - (1 - s_{t}A)x_{n+1}\|^2 \\
+ 2s_{t}\langle \mathcal{T}A^{N}A^{M}x_{t} - t(\mu FT\mathcal{T}A^{N}A^{M}x_{t} \gamma Vx_{t}) - Ax_{n+1}, x_{t} - x_{n+1} \rangle \\
\leq (1 - s_{t}\hat{\gamma})^2\|\mathcal{T}A^{N}A^{M}x_{t} - x_{n+1}\|^2 + 2s_{t}\langle \mathcal{T}A^{N}A^{M}x_{t} - x_{n+1}, x_{t} - x_{n+1} \rangle \\
+ 2s_{t}\langle \gamma Vx_{t} - t(\mu FT\mathcal{T}A^{N}A^{M}x_{t} \gamma Vx_{t}) - Ax_{n+1} - x_{n+1}, x_{t} - x_{n+1} \rangle \\
= (s_{t}^2\hat{\gamma} - 2s_{t}\hat{\gamma})\|x_{t} - x_{n+1}\|^2 + \|x_{t} - x_{n+1}\|^2 \\
+ (1 - s_{t}^2)\hat{\gamma}2(2\|x_{t} - x_{n+1}\|\epsilon_{n} + \epsilon_{t}^2) + 2s_{t}\mathcal{T}A^{N}A^{M}x_{t} - x_{n+1}||x_{t} - x_{n+1}\| \\
+ 2s_{t}\langle \gamma Vx_{t} - t(\mu FT\mathcal{T}A^{N}A^{M}x_{t} \gamma Vx_{t}) - Ax_{n+1} - x_{n+1}, x_{t} - x_{n+1} \rangle \\
\leq (s_{t}^2\hat{\gamma} - 2s_{t}\hat{\gamma})\|x_{t} - x_{n+1}\|^2 + \|x_{t} - x_{n+1}\|^2 + (1 - s_{t}^2)\hat{\gamma}2(2\|x_{t} - x_{n+1}\|\epsilon_{n} + \epsilon_{t}^2) \\
+ 2s_{t}\mathcal{T}A^{N}A^{M}x_{t} - x_{n+1}||x_{t} - x_{n+1}\| + 2s_{t}\langle \gamma Vx_{t} - t(\mu FT\mathcal{T}A^{N}A^{M}x_{t} \gamma Vx_{t}) - Ax_{n+1} - x_{n+1}, x_{t} - x_{n+1} \rangle \\
\leq (s_{t}^2\hat{\gamma} - 2s_{t}\hat{\gamma})\langle Ax_{t} - Ax_{n+1}, x_{t} - x_{n+1} \rangle + \|x_{t} - x_{n+1}\|^2 + (1 - s_{t}^2)\hat{\gamma}2(2\|x_{t} - x_{n+1}\|\epsilon_{n} + \epsilon_{t}^2) \\
+ 2s_{t}\mathcal{T}A^{N}A^{M}x_{t} - x_{n+1}||x_{t} - x_{n+1}\| + 2s_{t}\langle \gamma Vx_{t} - t(\mu FT\mathcal{T}A^{N}A^{M}x_{t} \gamma Vx_{t}) - Ax_{n+1} - x_{n+1}, x_{t} - x_{n+1} \rangle \\
\leq (s_{t}^2\hat{\gamma}\langle Ax_{t} - Ax_{n+1}, x_{t} - x_{n+1} \rangle + \|x_{t} - x_{n+1}\|^2 + (1 - s_{t}^2)\hat{\gamma}2(2\|x_{t} - x_{n+1}\|\epsilon_{n} + \epsilon_{t}^2) \\
+ 2s_{t}\mathcal{T}A^{N}A^{M}x_{t} - x_{n+1}||x_{t} - x_{n+1}\| + 2s_{t}\langle \gamma Vx_{t} - t(\mu FT\mathcal{T}A^{N}A^{M}x_{t} \gamma Vx_{t}) - Ax_{n+1} - x_{n+1}, x_{t} - x_{n+1} \rangle \\
\leq 2s_{t}\langle (1 - A)x_{t} - x_{n+1}, x_{t} - x_{n+1} \rangle + 2s_{t}\langle \gamma Vx_{t} - t(\mu FT\mathcal{T}A^{N}A^{M}x_{t} \gamma Vx_{t}) - Ax_{n+1} - x_{n+1}, x_{t} - x_{n+1} \rangle \\
\leq 2s_{t}\langle (1 - A)x_{t} - x_{n+1}, x_{t} - x_{n+1} \rangle + 2s_{t}\langle \gamma Vx_{t} - t(\mu FT\mathcal{T}A^{N}A^{M}x_{t} \gamma Vx_{t}) - Ax_{n+1} - x_{n+1}, x_{t} - x_{n+1} \rangle.
Utilizing the property $\text{LIM}_n a_n = \text{LIM}_n a_{n+1}$ of the Banach limit in (3.15), we obtain
\[
\text{LIM}_n \langle (A - I)x_t, x_t - x_n \rangle = \text{LIM}_n \langle (A - I)x_t, x_t - x_{n+1} \rangle
\]
\[
\leq \frac{s_t \bar{y}}{2} \text{LIM}_n \langle A(x_t - x_n), x_t - x_n \rangle
\]
\[
+ \frac{1}{2s_t} [\text{LIM}_n \|x_t - x_n\|^2 - \text{LIM}_n \|x_t - x_{n+1}\|^2]
\]
\[
+ \| TA^N A^M x_t - x_t \| \text{LIM}_n \| x_t - x_n \|
\]
\[
+ t \gamma V x_t - \mu FTA^N A^M x_t \| \text{LIM}_n \| x_t - x_n \|
\]
\[\leq \frac{s_t \bar{y}}{2} \text{LIM}_n \langle A(x_t - x_n), x_t - x_n \rangle + \| TA^N A^M x_t - x_t \| \text{LIM}_n \| x_t - x_n \|
\]
\[+ t \gamma V x_t - \mu FTA^N A^M x_t \| \text{LIM}_n \| x_t - x_n \|.
\]

Since as $t \to 0$,
\[s_t \langle A(x_t - x_n), x_t - x_n \rangle \leq s_t \|A\| \|x_t - x_n\|^2 \leq s_t K \to 0, \tag{3.17}\]
where $\|A\| \|x_t - x_n\|^2 \leq K$,
\[
\| TA^N A^M x_t - x_t \| \to 0, \quad \text{and} \quad t \| \gamma V x_t - \mu FTA^N A^M x_t \| \to 0 \quad \text{as} \quad t \to 0, \tag{3.18}
\]
we conclude from (3.16), (3.17), (3.18) that
\[
\text{LIM}_n \langle (A - I)\bar{x}, \bar{x} - x_n \rangle \leq \limsup_{t \to 0} \text{LIM}_n \langle (A - I)x_t, x_t - x_n \rangle
\]
\[
\leq \limsup_{t \to 0} \frac{s_t \bar{y}}{2} \text{LIM}_n \langle A(x_t - x_n), x_t - x_n \rangle
\]
\[
+ \limsup_{t \to 0} \| TA^N A^M x_t - x_t \| \text{LIM}_n \| x_t - x_n \|
\]
\[
+ \limsup_{t \to 0} t \| \gamma V x_t - \mu FTA^N A^M x_t \| \text{LIM}_n \| x_t - x_n \|
\]
\[= 0.
\]

This completes the proof. \qed

Now, using Theorem 3.3 we can establish the following strong convergence of the sequence $\{x_n\}$ generated by the multistep relaxed explicit extragradient-like scheme (3.3) to a point $\bar{x} \in \Omega$, which is also the unique solution of the VIP (3.2) whose proof is omitted.

**Theorem 3.4.** Let $\{x_n\}$ be the sequence generated by the explicit scheme (3.3), where $\{\alpha_n\}$ and $\{s_n\}$ satisfy the following conditions:

1. $\{\alpha_n\} \subset [0, 1], \{s_n\} \subset (0, \frac{1}{2})$ and $\alpha_n \to 0, s_n \to 0$ as $n \to \infty$;
2. $\sum_{n=0}^{\infty} s_n = \infty$.

If $\{x_n\}$ is weakly asymptotically regular (i.e., $x_{n+1} - x_n \to 0$), then $x_n$ converges strongly to a point $\bar{x} \in \Omega$, which is the unique solution of the VIP (3.2).
